Executive Summary

Key Findings

- As the capacity of the cruise ship fleet has grown by 68.1 per cent since 2009, the number of significant operational incidents has declined:
  - From 2009 to 2019, significant operational incidents have been on a downward trend with an average of 18.2 incidents a year, down from a seven-year average of 19.9 in 2015, 19.4 over eight years in 2016 and 17.7 over eleven years in 2019;
  - In 2019, only thirteen significant operational incidents occurred and there were no fatalities of either passengers or crew;
  - An average of 20 minor operational incidents are reported from 2009 to 2018, a figure which is also declining. It is noteworthy that the figure of 14 incidents in 2019 and 15 in 2018 were the lowest recorded in the eleven years covered by this report.
  - From 2009 to 2019, man overboard incidents have declined with an incidence of 0.00004 overboard reports per active lower berth (synonymous with a cabin’s bed) in 2019. This is 64 per cent of the figure recorded in 2009.
**Introduction**

This report is written in response to Cruise Lines International Association’s (CLIA) wish to evaluate the reliability of cruise ships from the perspective of analyzing the number and type of operational incidents (OI) during cruises, both at sea and in port.

GPW has for many years compiled an annual operational incident review, detailing significant cruise industry casualties identified from the public domain. GPW has published this data since 2015 in its “Cruise Industry Statistical Review.” In addition to this in-house data, the following sources have been researched in the compilation of this report for CLIA to include both significant and minor operational incidents over the last ten years:

**Daily Newspapers**
- Miami Herald
- The New York Times
- USA Today
- NY Daily News
- Daily Telegraph

**Shipping Industry Newspapers**
- Lloyds List
- TradeWinds

**Trade Publications**
- International Cruise and Ferry Review
- Cruise Industry News
- Seaways (Nautical Institute)
- Seatrade Cruise Review
- Safety at Sea International
- IMO News (quarterly)
- USCG Proceedings (quarterly)
- Cruise Line Annual Reports
- Flight International

**Official Websites**
- US National Transportation Safety Board
- US Department of Transportation
- US Coast Guard Marine Casualty Records
- UK Marine Accident Investigation Branch
- UK Civil Aviation Authority
- International Civil Aviation Organisation
- European Commission
- Eurostat
- British Admiralty
- Nautical Institute
- International Maritime Organisation
In all cases, incidents recorded were cross checked against records searched to verify the congruence of the reports. A minimum of two reports of the same incident were required for inclusion in this report.

**The Nature of Operational Incidents**

The following forms of operational incident are analyzed in this report.

- Fire;
- Technical breakdown, such as engine failure;
- Stranding or grounding;
- Passenger missing overboard and not recovered;
- Storm or wave damage;
- Collision/allision; and
- Sinking.

For the purposes of this report the authors have adopted the following definitions when researching operational incidents.

A “significant operational incident” (OI) is defined as one in which

- The ship suffers more than 24-hours’ delay to the published itinerary;
- Fatalities occur to either passengers or crew; or
- A serious injury occurs to either passengers or crew.

A “minor operational incident” is defined as one in which

- The ship is delayed for 24 hours or less against the published itinerary; or
- Minor injuries are suffered by either passengers or crew.
**Significant Operational Incidents**

The research defined above established that the following significant operational incidents or major non-conformities occurred worldwide in the oceangoing cruise industry during the years 2009 to 2019 inclusive as detailed in ES Table 1.

**Source:** G. P. Wild (International) Limited

During the period examined by this report, as illustrated in ES Figure 1, there was a downward underlying trend in significant operational incidents experienced by the cruise industry, although, as would be expected, the number of incidents fluctuated each year. The lowest recorded numbers have been in the last three years.
Figure ES 1: Underlying trend in Significant OI’s 2009 to 2019

Minor Operational Incidents

The research defined above, as shown in ES Table 2, established that the following minor operational incidents or non-conformities occurred worldwide in the oceangoing cruise industry during the years 2009 to 2018 inclusive.

Source: G. P. Wild (International) Limited
During the same period examined by this report, as illustrated in ES Figure 2, the number of minor operational incidents which involved delay to the ship or minor injury to passengers or crew, having remained constant at around 20 for most of the reporting period, has fallen significantly in the last three years. Again, as would be expected, the number of incidents fluctuated each year.

**Figure ES 2: Underlying trend in Minor Operational Incidents 2009 to 2019**

Source: G. P. Wild (International) Limited

*Trends in OI in relation to fleet size*

From 2009 to 2019, the active capacity of the cruise fleet worldwide grew by 68.1 per cent to reach 588,381 lower berths. Thus, it is useful to examine the trends in incidents per lower berth deployed and compare them with the growth in active lower berth capacity between 2009 and 2018. The results of this examination are depicted in ES Figure 3.

ES Figure 3 shows that when the expansion of the capacity of the cruise ship fleet is taken into account, the underlying trend in the occurrence of minor OI’s is also falling in a similar pattern to major OI’s.
**Man-overboard Incidents**

The research conducted under the above methodology and from the various sources defined has resulted in the following analysis of man overboard incidents involving both passengers and crew.

A total of 212 incidents have been identified of which 48 (28.2 per cent) were successfully rescued. The results of this research are summarized in ES Table 3.

Note: Not all columns cross check due to more than one person being involved in some incidents.

Source: G. P. Wild (International) Limited
The results of the search showed a significant decline in both the number of incidents and the number of fatalities over the eleven years studied though there were some fluctuations year-over-year in passenger fatalities. Regrettably however, 2018 and 2019 have seen an increase in such incidents.

**Figure ES 4: Trends in Overboard Incidents per Active Lower Berth 2009-18**

![Trends in Overboard Incidents per Active Lower Berth 2009-18](image)

Source: G. P. Wild (International) Limited

When compared with the growth in capacity in the industry over the study years, man overboard incidents continue on a downward trend, as demonstrated in Figure ES 4.
1. Introduction

Cruise Lines International Association (CLIA) wishes to continue to evaluate the reliability of cruise ships from the perspective of analyzing the number and type of operational incidents (OI) during cruises, both at sea and in port. This report is the seventh annual report, the first report covered 2009 to 2013 with subsequent reports including 2014 to 2019. It is contended that cruise ship reliability is at an all-time high with fewer OI episodes both in terms of absolute numbers and as a percentage of sailings. CLIA has therefore re-commissioned G. P. Wild (International) Ltd (GPW) to undertake research aimed at establishing the relevant data.

1.1 Sources of Data

GPW has for more than 16 years compiled an annual review, detailing significant cruise industry casualties identified from the public domain. Until 2015 this data was published each year in GPW’s “Cruise Industry Statistical Review.” In addition to this in-house data, the following sources were researched in the compilation of this report for the CLIA:

Daily Newspapers
• Miami Herald
• The New York Times
• USA Today
• NY Daily News
• Daily Telegraph

Shipping Industry Newspapers
• Lloyds List
• TradeWinds

Trade Publications
• International Cruise and Ferry Review
• Cruise Industry News
• Seaways (Nautical Institute)
• Seatrade Cruise Review
• Safety at Sea International
• IMO News (quarterly)
• USCG Proceedings (quarterly)
• Cruise Line Annual Reports
• Flight International

Official Websites
• US National Transportation Safety Board
• US Department of Transportation
• US Coast Guard Marine Casualty Records
1.2 The Research Methodology

In addition to in-house information and use of the various sources named above, the research contained in this report was taken primarily from the British Library in London and supplemented by information from the London Business Library. The British Library was requested to provide archive copies of various daily and industry newspapers and trade publications listed above from 2009 to 2014. Certain publications were made available in hard copy and others in an electronically archived format.

Other trade publications such as Cruise Industry News, Seatrade Cruise Review and Flight International are received on subscription by GPW and hence these archived publications were studied at the offices of GPW.

Since 2014, official and other websites were reviewed from the desktop and data gleaned from such searches was added to the significant quantity of data on the subject already held in the GPW in-house database. It should be noted that certain websites also include ferry industry data, which is not part of this report.
2. Cruise Industry Operational Incidents

2.1 Definition of Operational Incidents

The following forms of operational incident will be analyzed in this report.

- Fire;
- Technical breakdown such as engine failure;
- Stranding or grounding;
- Passenger missing overboard and not recovered;
- Storm or wave damage;
- Collision/allision; and
- Sinking.

Under the terms of the International Maritime Organization’s ISM Code (International Safety Management Code), operational incidents are referred to by the terms “non-conformities” and “major non-conformities.” These are defined as follows:

- A “non-conformity” means an observed situation where the objective evidence indicates the non-fulfilment of the ISM Code.
- A “major non-conformity” means an identifiable deviation, which poses a serious threat to the safety of personnel or the ship or a serious risk to the environment that requires immediate corrective action.

Further study of the Code indicates that these official definitions may not be entirely suited to the circumstances of the cruise industry and the objectives of this report. An operational incident in the cruise industry may inconvenience passengers while not necessarily falling under the strict terms of the ISM Code.

For the purposes of this report, the authors have adopted the following definitions when researching operational incidents.

A “significant operational incident” (OI) is defined as one in which:

- The ship suffers more than 24-hours delay to the published itinerary;
- Fatalities occur to either passengers or crew; or
- A serious injury occurs to either passengers or crew.

A “minor operational incident” is defined as one in which

- The ship is delayed for 24 hours or less against the published itinerary; or
- Minor injuries are suffered by either passengers or crew.
2.2 **Significant Operational Incidents**

The research defined above has established that the following significant operational incidents or major non-conformities occurred worldwide in the oceangoing cruise industry from 2009 to 2019.

Source: G. P. Wild (International) Limited

Evidently, during the period examined by this report, as illustrated in Figure 2.1, there was a downward underlying trend in significant operational incidents experienced by the cruise industry, although, as would be expected, the number of incidents fluctuated each year. The range between 16 and 21 was apparently becoming established as the norm, but 2017 was a particularly positive year with only 13 major incidents reported. This figure has been repeated in 2019. Given the rapid expansion of the worldwide fleet in recent years, as demonstrated in Figure 2.2, this downward trend is particularly noteworthy.

There were no fatalities of either passengers or crew in 2019.
Figure 1: Underlying trend in Significant OI’s 2009 to 2019

Source: G. P. Wild (International) Limited

As shown in Figure 2.2, during the same period the capacity of the active fleet was growing from 349,900 to 588,381 lower berths, which represents an increase of 68.1 per cent.

Figure 2: Growth in Capacity of the Active Cruise Fleet 2009-2019 (LBs)

Source: G. P. Wild (International) Limited
More comprehensive details of individual significant operational incidents, by category, are presented in Appendix 1.

2.3 **Minor Operational Incidents**

The research defined above has established, as shown in Table 2.2, that the following minor operational incidents or non-conformities occurred worldwide in the oceangoing cruise industry during the years 2009 to 2019 inclusive.

Source: G. P. Wild (International) Limited

While the number of minor incidents has fluctuated from year to year, in 2018 they fell to 15, below the previous range of 18 to 25 per year. In 2019 the number was still less at 14 incidents. This is shown in Table 2.2 and as illustrated in Figure 2.3. The number of minor operational incidents, which involved injury to passengers or crew had declined significantly over the reporting years but in 2019 a single rogue wave incident resulted in ten injuries, five to passengers and five to crew.
Figure 3: Underlying trend in Minor Operational Incidents 2009 to 2019

Source: G. P. Wild (International) Limited

Details are minor operational incidents are provided in Appendix 2.

Figure 4: Comparative development of Active Lower Berths (LBs) and OI’s per Active LB

Source: G. P. Wild (International) Limited

As was shown in Figure 2.2, from 2009 to 2019, the active lower berth capacity of the cruise fleet worldwide grew by 68.1 per cent. Thus, it is useful to examine the trends in incidents per lower berth deployed and compare them with the growth in active lower
berth capacity between 2009 and 2019. The results of this examination are depicted in Figure 2.4.

As shown in Figure 2.4, when the expansion of the capacity of the cruise ship fleet is considered, it is worth noting that the underlying trend in the occurrence of minor OI’s is now mirroring the fall in major OI’s.

### 2.4 Man Overboard Incidents

The research conducted under the above methodology and from the various sources defined has resulted in the following analysis of man overboard (MOB) incidents involving both passengers and crew. In discussions with cruise line representatives, they indicated that in every case where the cause of the MOB was established following a careful investigation it was found to be the result of an intentional or reckless act. There were some incidents; however, which were impossible to determine a motive. The results of this research are summarized in Table 2.3.

Note: Not all columns cross check due to more than one person being involved in some incidents.
Source: G. P. Wild (International) Limited

Based on Figure 2.5 the results of the search show that after a significant decline in both the number of incidents and the number of fatalities over the years from 2009 to 2017, the year 2018 saw a rise in the number of incidents. In 2019 the number of incidents has again risen though the numbers rescued are now at an all-time high, with 36% of jumpers rescued in 2019.

Crew fatalities remain around the average of 4.5 per year period, around one in every 55,000 crew serving in the fleet at any one time in 2019. One third of all the man overboard incidents in the ten-year period have involved crew rather than passengers. On the largest ships there can be more than 2,000 crew serving at any one time.
Clearly during this period, the size of the cruise fleet continued to expand as the demand for cruises grew, as noted at the beginning of this section, and the implications of this changing fleet structure in terms of overboard incidents is examined in Figure 2.6. This shows that after a low of 12 incidents in 2013 overboard incidents increased
over the subsequent two years to reach 24 in 2015. In 2017, it has returned close to a historically low level but this was not maintained in 2018 and 2019 when incidents increased to 23 and 25 respectively. Nonetheless the underlying trend remains downward between 2009 and 2019.
